I am still trying to figure out how to fix it. [^1]: Horseshoe sign The horseshoe sign, also known as the Lassa fever horseshoe sign or simply Lassa fever, is a radiographic sign of a high-risk state for fulminant Lassa fever. Patients with viral hemorrhagic fever may show focal or diffuse subpleural consolidation that shows a radio-opaque border outlining the consolidation and which appears to resemble the Lassa fever virus's characteristic "horse shoe" shape. The horseshoe sign is a radiological sign to suggest high risk for Lassa fever. See also High-risk state for HIV References Category:HepatologyAge and sex related reference values for coagulation factors and inhibitors in healthy young Chinese adults. As a major cause of morbidity and mortality in China, venous thrombotic disease is closely related to coagulation. Thus, in order to assess risk factors for thrombosis in China, it is necessary to establish a database on the coagulation system. With a sample size of 2120 healthy young Chinese volunteers aged between 20 and 44 years, with a mean age of 33.1 years for men and 30.5 years for women, this study was designed to establish age and sex related reference values for haemostatic coagulation factors and inhibitors in healthy Chinese adults. The subjects were divided into three age groups: 20-24, 25-29, and 30-44 years. Levels of coagulation factors and inhibitors were measured by either chemiluminescence or immunoturbidimetry. The data was processed using standard statistical methods. Reference values were established for each age group. The mean levels of coagulation factors and inhibitors did not vary significantly with age in the different sex groups. Reference values were established for each age group and the results were compared with those obtained from Caucasians. United 2d92ce491b
